

Name:- Rahul Kumar

Regd. No :- 2141011217

Task - 1

- **Process scheduler :-** The scheduler decides which gets to use the CPU and for how long. It ensures efficient multitasking and fair resource distribution among processes.
- **Memory management :-** This manages memory allocation and paging. It tracks which memory is used by which process, and handles swapping between RAM and disk when needed.
- **Virtual file system :-** The vfs act as an abstraction layer for various file system (e.g., ext4, NTFS). It provides a uniform interface for application to access files.
- **Network stack :-** The network stack implements protocols like TCP/IP. It manages data transmission over network, allowing processes to communicate through sockets & APIs.
